User administration

User administration at TightGate-Pro can be carried out in various ways. TightGate-Pro supports decentralised user administration via Active Directory as well as local user administration via password logon or via single sign-on with user certificates. The individual methods of user administration can also be combined with each other. Please select the type of user administration that suits your network:

- User administration via Active Directory Single Sign-on (SSO)
- User administration via user certificates Single Sign-on (SSO)
- User administration with access data (user name + password)

In addition to the special settings for user administration, there are a number of tasks that are carried out by the administrator ** *maint*** and are always valid. The tasks include:

- Fixing problems with user profiles
- Direct login with an administrator role
- Create and manage user groups
- Open remote maintenance for support of m-privacy GmbH

Hinweis

The settings listed here as administrator **// maint//** concern individual users or user groups. Global settings of a fundamental nature are made by the administrator **// config//** in the respective menus.
