

File transfer for macOS

Any programme for file transfer according to the SFTP protocol is suitable for using the file lock under macOS. In particular, the programme **Cyberduck** has proven itself for exchanging data between TightGate-Pro Server and an Apple workstation. It can also be used to set up a certificate-based login. For more information, please refer to the programme documentation or consult the technical customer service of m-privacy GmbH .

Installation

The installation is carried out after retrieving and unpacking the archive under macOS by simply moving the application into the programme directory. **Cyberduck** is ready to run immediately. An installer does not need to be run through.

Configuration

The configuration is done with the usual parameters analogous to the configuration under Linux. If necessary, the documentation of the programme should be consulted. The technical customer service of m-privacy GmbH provides support for the configuration on request; separate costs may be incurred for this.
