

# Restoring data from a backup

While the administrator **backuser** is responsible for creating the backups, the restore is done by **config** (system configuration) or **maint** (user accounts and groups).

The complete restoration of a TightGate-Pro server, for example after a new installation, requires the following steps to be carried out in exactly this order:

- [Restore the system configuration](#)
- [Restore the user accounts](#)
- [Restore the groups](#)
- [Restore bookmark archives](#)

## This is always needed

Before the restore can be carried out, the corresponding backup must be available locally on the TightGate-Pro in the directory **/home/backuser/backup** of the administrator **backuser** or on a USB mass storage device that has been [prepared accordingly](#) **unencrypted**.

### Hinweis

If backups are to be transferred manually, please note the information in the FAQ on [TightGate-ProHow can I transfer backups manually?](#)

The backup files that are saved locally from the system are always unencrypted. Only the backups on external media can be encrypted, depending on the configuration. The private key that may be required for decryption is regularly not on the TightGate-Pro, but must be provided externally.

### Achtung

Existing data is overwritten during the restore process. To protect against data loss if the wrong backup is selected, it is always recommended to create a current backup immediately before the restore.

**Selecting the source:** For each restore (independent of roles), the source of the backup is queried at the beginning. All available partitions and hard disks are displayed. However, only **local** and possibly additional hard disks (e.g. USB) marked with **sdb\*** are relevant. After selection, all back-ups available on the corresponding medium are displayed, whereby **back-last** always refers to the last backup created by the system.

## Restoring the system configuration

Restoring the system configuration always includes the parameters of all setting options of the administrator accesses. The remaining contents of the backup depend on the settings made for the backup type [settings for the backup type](#). Basically not included in the backup are:

- Program and system files that are part of the installation packages for TightGate-Pro.
- Installation files and configuration data of the add-ons for the web browser that were installed by the user.

Here's how

- Logging on to the console as administrator **config**
- Call the menu item **Basic settings > Restore**
- Select the backup to be restored (select with space key)
- Select the backup file and confirm the security prompt.

### Achtung

When restoring system configurations, it is absolutely necessary that the version of the **mprivacy-tools** used in the backup is the same as that of the newly installed system. Otherwise, inconsistencies and incorrect configurations may occur.

## Restoring user accounts

The restoration of user accounts depends on the selected [backup type](#). Groups and their configuration are generally not included.

This is how it works

- Log on to the console as administrator **maint**
- Call the menu item **User administration > Regenerate user**
- Select the source (mark with space key)
- Selecting the backup to be restored (select with space key)
- Select the user accounts to be restored and confirm security prompt

## Restore groups

Restoring groups includes all groups and their configuration, as well as the assignment to the respective users, if they exist. It is not possible to select individual groups.

This is how it works

- Log on to the console as administrator **maint**

- Call the menu item **Group management > Restore all groups**
- Select the backup to be restored (select with space key)
- Confirm security prompt

## Restore bookmark archives

Restoring bookmark archives only includes the archive files. Restriction to individual user accounts is not possible. If an archive is to be restored to a user, the user must manually select the file in the web browser.

This is required:

Make sure that the bookmark archives are included in the backup. The following points must be fulfilled for this:

- Are the bookmark archives switched on under **config > Settings > Authentication > Bookmark archive = Yes?**
- Was one of the two backup types selected that contains the bookmark archives? To be checked under **backuser > Backup type > System bookmark archive** or **System and user data**

This is how it works

- Logging on to the console as administrator ***maint***
- Call the menu item **User administration > Regenerate bookmark archive**
- Select the backup to be restored (select with space key)
- Confirm security prompt
